

Thermography Screening Patient Disclosure

Thermography is a non-contact and non-invasive procedure. The value of thermography as a screening tool is its ability to measure skin temperature changes. It offers information that no other procedure can provide.

Thermography is not a replacement for or alternative to any other form of imaging. Thermography is a complementary procedure; one test does not replace another. Thermography is meant to be used in addition to other tests or procedures.

Thermography captures and records temperature variations on the skin, which provides vital information directly influenced by complex metabolic and vascular activity. This information does not in any way suggest diagnosis or treatment. Studies show that the patient benefits from a multimodal approach, which includes examinations by a doctor and any other tests that may be ordered by your doctor. **A reported “Thermographically Suspicious” finding does not indicate that it is suspicious for any specific disease.** *However, any suspicious finding will be accompanied by a strong and intentional recommendation for further clinical evaluation.*

By signing below, I certify that I have read and understand the statement above and consent to the examination.
